

Interlit GmbH is the distribution organisation for the well-known and proven library software LITTERA (www.littera.eu) in the international domain. LITTERA can be delivered in the respective country's national language.

For distribution of the LITTERA software, we are interested in working together with reputable and competent distribution partners in various countries.

More on LITTERA:

For over 15 years, LITTERA has been a competent and reputable software partner for a wide range of different types of library, as well as for schools, archives, and similar establishments. To date, over 3,000 libraries in the German-speaking world have decided on LITTERA software. Public and school libraries, scientific libraries, company libraries, libraries in hospitals, as well as in the field of law, such as for lawyers, courts, etc.

In particular, the LITTERA library software is designed for small and medium-sized libraries, which hold up to around 150,000 media units. By means of a usage-oriented price system, small libraries with upwards of approximately 1,000 media units also use LITTERA.

Insiders know the different work methods, requirements, and demands of the various libraries.

Special features of the LITTERA library systems:

- The content-specific performance of the software is attuned to the libraries mentioned; the overhead which large libraries require does not encumber LITTERA users in their daily work.
- LITTERA is flexible enough: for each library, the right LITTERA.
- Extreme user-friendliness, despite high performance and considerable flexibility. What makes a piece of software good, is if you, the user, feel as though the program was custom-developed for you.

We pay a lot of attention to developing solutions for a multitude of details. These 'little touches', often are not (or cannot be) taken into account when choosing a piece of software, but they have a lasting affect on the comfort and operational reliability as the software is used in day-to-day work. These details ultimately determine the overall benefit for the library.

A large number of libraries have stopped using library software from other manufacturers, and have become enthusiastic LITTERA users with an appreciation of how pleasant it is to work with LITTERA.

LITTERA encompasses all administrative aspects of a library. If there is Internet access in the library, the numerous Internet functions can be used. LITTERA has an integrated email system.

- Exceptionally fast cataloguing of books and other media by means of the 'online cataloguing' module. To use this, the library must have Internet access. Enter the ISBN, and LITTERA seeks the book's data in international databases and inserts it automatically. Different screen masks for different media.
- Different research systems for librarians and library users are integrated.
- Lending procedure with freely definable fee models, flexible lending periods, etc. Lending can be processed particularly quickly and easily with the barcode system. Barcode labels can be made with LITTERA and a normal printer.
- Reminders in various forms, also via email.
- Purchasing of books and media.
- Various types of statistical analysis.
- Establishment of an inventory.
- and much more.

With the 'Internet library' module, the library can offer its users 'round-the-clock service', regardless of its opening hours.
